

CRASH DETECTION

Ensure your users get help when they need it most

With an average of 3,700 global crash-related deaths every day, Crash Detection is a powerful feature for apps looking to connect with their customers in a deeper way and help make the roads safer for everyone.

Crash Detection from Arity enables mobile apps to detect accidents in real time. With tens of thousands of crashes identified in the past year, our advanced technology takes signals from a user's phone and other devices and uses a set of proprietary algorithms to determine whether an accident has occurred.

With integrations that personalize the experience for users, apps can contact and dispatch emergency help, alert loved ones, start the process of generating an insurance claim, and more.

Key benefits:

- : Automatically alert emergency services after a crash
- : Instantly notify loved ones and key contacts when a crash occurs
- : Connect with customers post-collision with helpful content
- : For insurance apps, automatically start the insurance claim process for a rapid customer experience
- : For ride-sharing apps, alert a fleet manager and keep a record of incidents over time

"Life360 saved my life... I have crash detection on, and it truly works. It let my husband know I was in a car accident and sent him my location."
